A Research on Practical Use of Information Technology and Teaching-

materials

in the Department of Early Child Education

－Creating Picture-books with 'PowerPoint'－

Miki Ogawa & Takehiro Tomida

The Ministry of Education, Culture, Sports, Science and Technology tried a

more new rule on April 1, 2000.　The subject of "Information technology"

became compulsory in order to acquire kindergarten teacher's license.

The contents of the lesson are to learn computing, including "word

processor practice", "computer practice", "education software practice".

This research is the report of lessons using "power point".　The purpose of

this research is the digitalization of a picture book.　The digital picture book

fused "the picture", "movement" and "voice". This digital picture book is a

characteristic to be using the raw voice of the teacher.　This research was

useful as the flowchart of using power point to make the digital picture book.

Making digital picture books is an effective tool for teaching young children.

From now on, we are going to study the effect of teaching children with the

digital picture books.
